# Recent Advances in Al Planning: A Unified View

 $AAAI_{-2000}$  Tutorial  $|MA_2|$ 

### Subbarao Kambhampati

### Arizona State University

rao@asu.edu http://rakaposhi.eas.asu.edu/planning-tutorial

URL will have the up to date version

This file contains the slides that were used in my AAAI-2000 tutorial (July 31st, 2000). They differ only in minor aspects from the published tutorial notes.

Please note that the slides here include some that I had skipped over due to lack of time-these include:

- --Disjunctive refinement of non-state space plans
- --Automated learning of domain-specific control knowledge
- --Extensions of classical planning model to stochastic and partially observable worlds

I would appreciate any feedback you might have on the slides or the actual tutorial.

Thanks for your interest Subbrao Kambhampati, 9th August 2000

MA: Recent Advances in ALBI

# Planning is hot...

New people. Conferences. Workshops. Competitions. Inter-planetary explorations. So, Why the increased interest?

- Significant scale-up in the last 4-5 years
  - Before we could synthesize about 5-6 action plans in minutes
  - Now, we can synthesize 100-action plans in minutes
    - » Further scale-up with domain-specific control
- Significant strides in our understanding
  - Rich connections between planning and CSP(SAT) OR (ILP)
    - Vanishing separation between planning & Scheduling
  - New ideas for heuristic control of planners
  - Wide array of approaches for customizing planners with domain-specific knowledge

MAz: Recent Advances in Al Planning - A Hulkad 1.

Subbarao Kambhamp,

### **Overview**

- The Planning problem
  - Our focus
  - Modeling, Proving correctness
- \* Refinement Planning: Formal Framework
- Conjunctive refinement planners
- Disjunctive refinement planners
  - Refinement of disjunctive plans
  - Solution extraction from disjunctive plans
    - » Direct, Compiled (SAT, CSP, ILP, BDD)
- Heuristics/Optimizations
- Customizing Planners
  - User-assisted Customization
  - Automated customization
- Support for non-classical world;

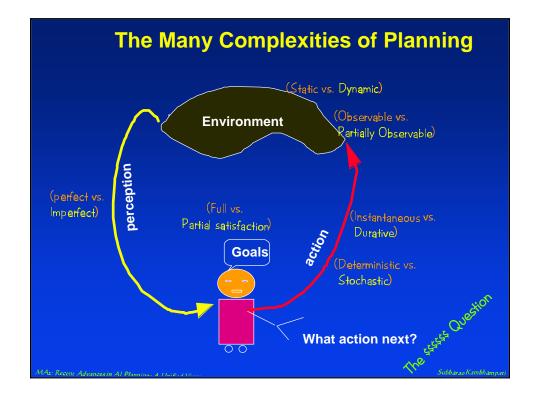

MA: Recent Advances in ALBI

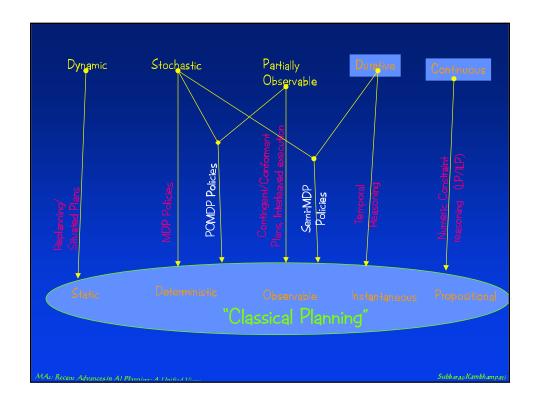

Suhharan Kambhamnai

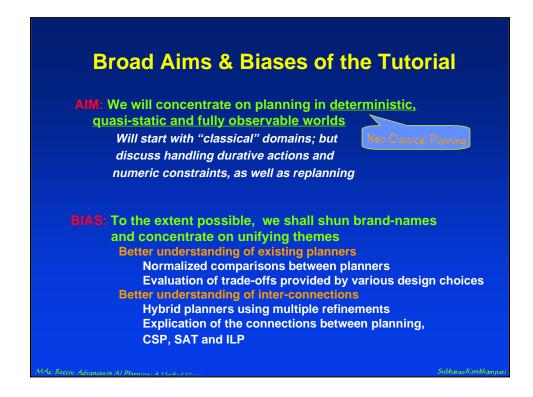

# Planning: The big picture

- Synthesizing goal-directed behavior
- Planning involves
  - Action selection; Handling causal dependencies
  - Action sequencing and handling resource allocation
    - » typically called **SCHEDULING**
  - Depending on the problem, plans can be
    - » action sequences
    - » or "policies" (action trees, state-action mappings etc.)

MAz: Recent Advances in Al Planning - A Hairadt

### Why Care about "neo-classical" Planning?

- Most of the recent advances occurred in neo-classical planning
- Many stabilized environments satisfy neo-classical assumptions
  - It is possible to handle minor assumption violations through replanning and execution monitoring

"This form of solution has the advantage of relying on widely-used (and often very efficient) classical planning technology." Boutilier, 2000

- Techniques developed for neo-classical planning often shed light on effective ways of handling non-classical planning worlds
  - Currently, most of the efficient techniques for handling non-classical scenarios are still based on ideas/advances in classical planning

MAz: Recent Advances in Al Planning - A Unified 1

Subbarao Kambhampa

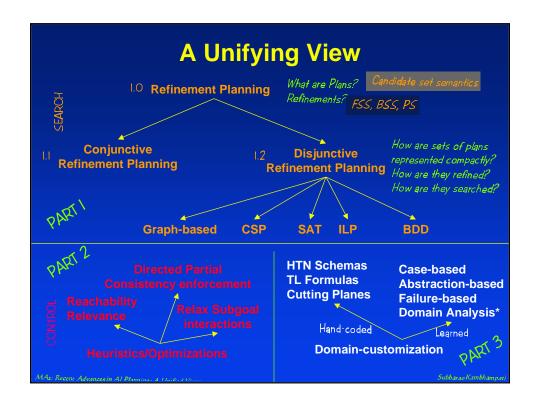

## **Applications (Current & Potential)**

- Scheduling problems with action choices as well as resource handling requirements
  - Problems in supply chain management
  - HSTS (Hubble Space Telescope scheduler)
  - Workflow management
- Autonomous agents
  - RAX/PS (The NASA Deep Space planning agent)
- Software module integrators
  - VICAR (JPL image enhancing system); CELWARE (CELCorp)
  - Test case generation (Pittsburgh)
- Interactive decision support
  - Monitoring subgoal interactions
    - » Optimum AIV system
- Plan-based interfaces

Subbarao Kambhampat

**Modeling Classical Planning ♦States are modeled in terms of (binary)** state-variables -- Complete initial state, partial goal state At(A,M),At(B,M) ¬ln(A), ¬ln(B) Actions are modeled as state transformation functions -- Syntax: ADL language (Pednault) **Earth** -- Apply(A,S) =  $(S \setminus eff(A)) + eff(A)$ (If Precond(A) hold in S) At(A,E), At(B,E),At(R,E)Effects At(R,M),  $\neg At(R,E)$  $\neg ln(o_1)$  $ln(o_1)$  $\forall \operatorname{Jn}(x) \Rightarrow \operatorname{At}(x, M)$  $\& \neg At(x, E)$ Unload(o₁) Load(o₁) Fly() Prec.  $At(o_1,I_1), At(R,I_1)$ In(o₁) At(R,E)

## Some notes on action representation

- STRIPS Assumption: Actions must specify all the state variables whose values they change...
- No disjunction allowed in effects
  - Conditional effects are NOT disjunctive
    - » (antecedent refers to the previous state & consequent refers to the next state)
- Quantification is over finite universes
  - essentially syntactic sugaring
- All actions can be compiled down to a canonical representation where preconditions and effects are propositional
  - Exponential blow-up may occur (e.g removing conditional effects)
    - » We will assume the canonical representation

Action A

Eff: If P then R
If Q then W

Action A1
Prec: P, Q
Eff: R, W

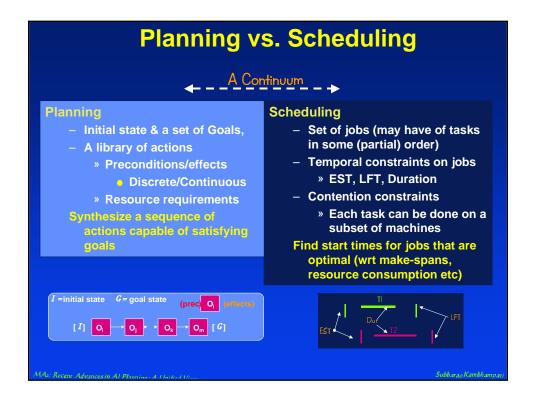

Action A2
Prec: P, Q

# The Refinement Planning Template Refineplan( P: Plan set) 0\*. If «P» is empty, Fail. 1. If a minimal candidate of P is a solution, return it. End 2. Select a refinement strategy R Apply P to P to get a new plan set P' 3. Call Refine(P') - Termination ensured if R is complete and monotonic - Solution check done using one of the proofs of correctness Issues: 1. Representation of plan sets (Conjunctive vs. Disjunctive) 2. Search vs. solution extraction 3. Affinity between refinement and proof used for solution check

# Refineplan(P: Plan) 0\*. If «P» is empty, Fail. 1. If a minimal candidate of P is a solution, terminate. 2. Select a refinement strategy R. Appply R to P to get a new plan set P' 3. Split P' into k plansets 4. Non-deterministically select one of the plansets P' Call Refine(P')

### Two classes of refinement planners

### Conjunctive planners

- Search in the space of conjunctive partial plans
  - Disjunction split into the search space
    - » search guidance is nontrivial
  - Solution extraction is trivial
- ♦ Examples:
  - STRIPS & Prodigy
  - SNLP & UCPOP
  - NONLIN & SIPE
  - UNPOP & HSP

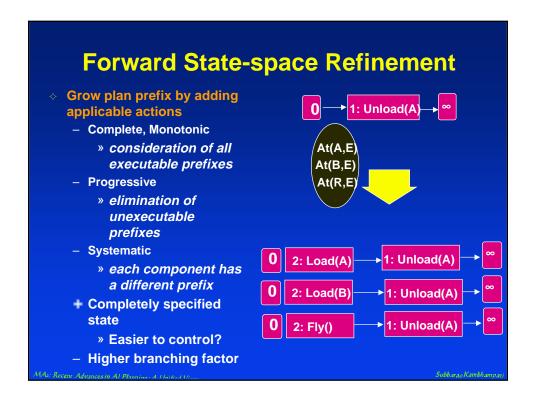

### Disjunctive planners

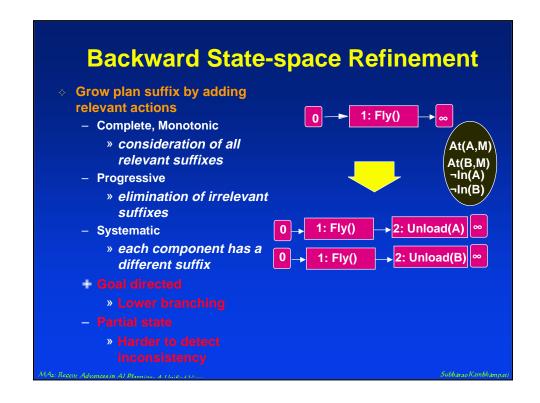

- Search in the space of disjunctive partial plans
  - Disjunction handled explicitly
  - Solution extraction is nontrivial
    - » CSP/SAT/ILP/BDD methods
- ♦ Examples:
  - Graphplan,IPP,STAN
  - SATPLAN
  - GP-CSP
  - BDDPlan, PropPlan

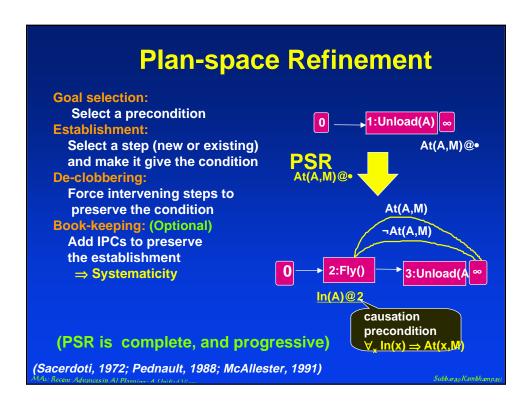

MA2: Recent Advances in Al Planning - A HniRad

# CONJUNCTIVE REFINEMENT PLANNING A Unifying View | Proceedings | Proceeding | Proceding |

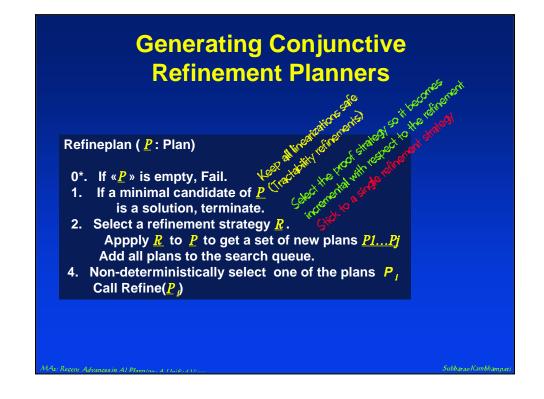

## **Issues in instantiating Refineplan**

- Although a planner can use multiple different refinements, most implementations stick to a single refinement
- Although refinement can be used along with any type of correctness check, there is affinity between specific refinements and proof technques (support finite differencing)
  - FSR and Progression based proof
  - BSR and Regression based proof
  - PSR and Causal proof
- Although it is enough to check if any one of the safe linearizations are solutions, most planners refine a partial plan until all its linearizations are safe
  - Tractability refinements (pre-order, pre-satisfy)

# **Case Study: UCPOP**

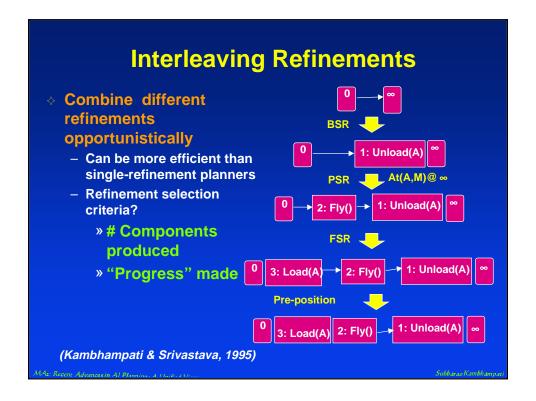

### Refineplan ( P: Plan)

- 0\*. If P is order inconsistent, FAIL.
- 1. If no open conditions and no unsafe IPCs, SUCCESS.
- 2. Generate new plans using either 2' or 2" Add the plans to the search queue
- 2'. Remove an open condition c@s in P.
  - 2.1. For each step s' in P that gives c, make a new plan P' = P + (s' < s) + IPC s'-c-s
  - 2.2. For each action A in the domain that gives c, make a new plan P' = P + sn:A + (sn < s) + IPC sn-c-s.
    - 2.2.1. For each precondition c' of A, add
    - c'@sn to the list of open conditions of P'.

      2.2.2. For each IPC s'-p-s", if sn deletes p, add
      [s'-p-s"; sn] to the list of unsafe IPCs of P'
- 2". Remove an unsafe IPC [s'-p-s"; s"'] from P.

  Make two plans: P' = P + s"' < s' P" = P + s" < s"
- 3. Non-deterministically select one of the plans P<sub>1</sub> from
- the search queue and Call Refine(P)

### **Conjunctive planners: The State of the Art**

- Vanilla state-space (FSR/BSR) planners were known to be less efficient than vanilla plan-space planners
  - Several research efforts concentrated on extending plan-space approaches to non-classical scenarios
- However, State-space planners seem to have better heuristic support than plan-space planners at this time
  - Distance-based heuristics seem particularly useful for state-space planners
- But, plan-space planners are alleged to provide better support for incremental planning, durative actions etc.
  - replanning, reuse and plan modification, temporal reasoning» IXTET, HSTS, RAX....

Charge: Either develop effective approaches for replanning etc. in state-space planners or develop good heuristics for plan-space planners

# **Disjunctive Planning**

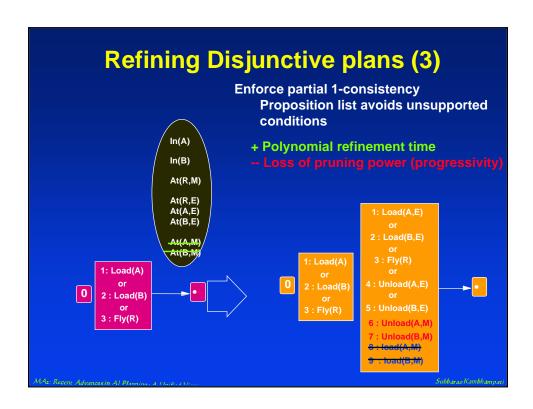

- Idea: Consider Partial plans with disjunctive step, ordering, and auxiliary constraints
- Motivation: Provides a lifted search space, avoids re-generating the same failures multiple times (also, rich connections to combinatorial problems)
- ♦ Issues:
  - Refining disjunctive plans
    - » Graphplan (Blum & Furst, 95)
  - Solution extraction in disjunctive plans
    - » Direct combinatorial search
    - » Compilation to CSP/SAT/ILP

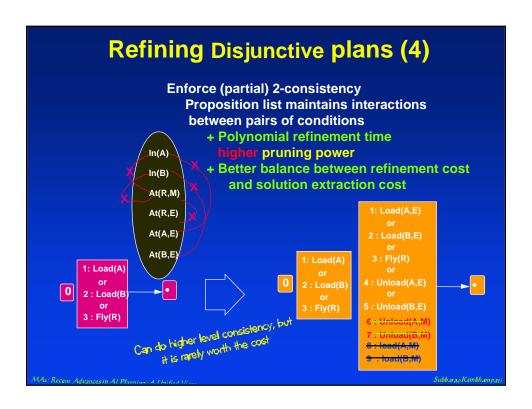

MA: Recent Advances in ALBI

# Open issues in disjunctive refinement rected partial consistency

- Mutex propagation is a form of reachability analysis
  - » Relevance analysis?
- Higher levels of directional consistency?
  - » Typically not cost effective

### Supporting refinements other than FSR

- Direct naïve refinements are easy to support; enforcing an appropriate level of consistency is harder
- Some "relevance" based approaches exist for BSR
  - » Inseperability, backward mutex [
    - Kambhampati et. al. ECP, 1997
  - » Can be used in conjunction with reachability analysis
- Enforcing effective consistency for PSR is still virgin territory...

MA2: Recent Advances in Al Planning - 4 (16:0-31)

Suhharao Kambhamnai

# **Solution Extraction in Disjunctive Plans**

- Verify if some minimal candidate of the disjunctive plan is a solution ("Model Finding")
  - » Involves (implicit or explicit) use of proof strategies
- Direct methods: Can be solved using special techniques customized to the disjunctive structure
  - » Graphplan backward search; Graphplan local search
- Compilation methods: Generate a set of constraints, whose satisfaction ensures that a substructure of the disjunctive structure is a solution. Find a model for the constraints.
  - » Constraints will correspond to lines of proof
    - Progression proof, regression proof, causal proof
  - » Constraints can be in any standard form
    - e.g. CSP, SAT, ILP, BDD

MAz: Recent Advances in Al Planning - A Unified 1

Subbarao Kambhampa

# **Graphplan Backward Search**

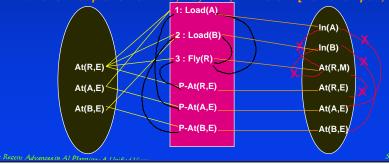

(Direct Search I)

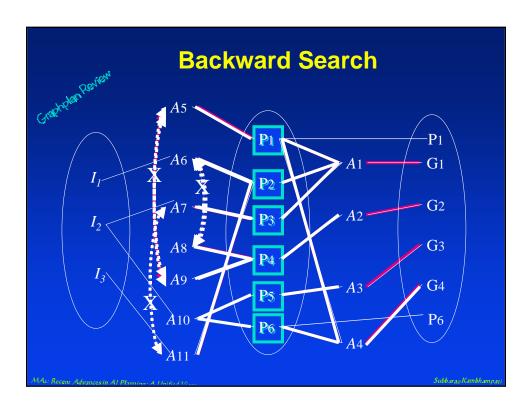

Objective: Find a sub-graph of the plangraph that corresponds to a valid plan.

Method: Start from the goal propositions at the last level
Select actions to support the goals so that no two are *mutex* (choice)
Recurse on the preconditions of the selected actions

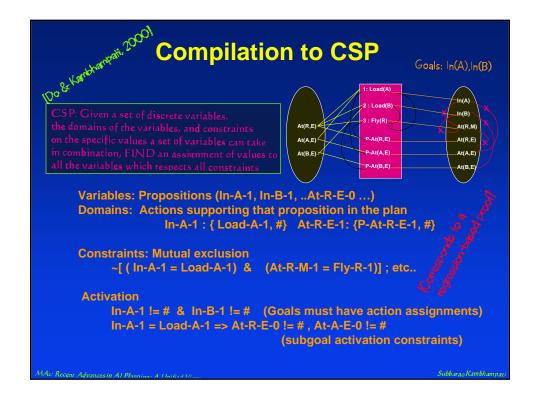

(recursion ends at the initial state)
(When backtracking over the goals at a level, memoize them)

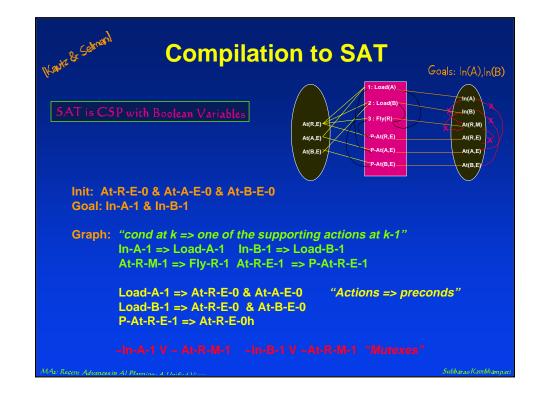

Optimizations: Adaptation of DVO, FC, EBL, DDB etc... [Kambhampati, JAIR 2000]

# Other Direct Extraction Strategies Motivation: No compelling reason for making the search for a valid subgraph backward, or systematic... Alternatives: Forward Search (dynamic programming) [Parker & Kambhampati; 98,99; Blum & Langford 98] Systematic Undirectional search [Rintanen, 98] \*\*Select an action anywhere in the plan-graph for inclusion in the solution; Propagate consequences (adapts normal CSP Search to plan-graph) Local Search [Gerevini et. al., 99]

### **Compilation to Integer Linear Programming**

ILP: Given a set of real valued variables, a linear objective function on the variables, a set of linear inequalities on the variables, and a set of integrality restrictions on the variables, Find the values of the feasible variables for which the objective function attains the maximum value

-- o/1 integer programming corresponds closely to SAT problem

- Motivations
  - Ability to handle numeric quantities, and do optimization
  - Heuristic value of the LP relaxation of ILP problems
- Conversion
  - Convert a SAT/CSP encoding to ILP inequalities
    - » E.g.  $X \vee Y \vee Z => x + (1 y) + z >= 1$
  - Explicitly set up tighter ILP inequalities (Cutting constraints)
    - » If X,Y,Z are pairwise mutex, we can write x+y+z <= 1 (instead of x+y <=1; y+z <=1; z +x <= 1)</p>

Az: Recent Advances in Al Planning: A Unified V.

Water & Mail Vossen et. at Vossen et. B. Opropologie Godkran & Opropologie Subbarac Kambhampai

# Compilation to Binary Decision Diagrams (BDDs)

BDDs support compact representation and direct manipulation of boolean formulae on a finite set of propositions. |Popular in CAD community|
Standard algorithms for converting aboolean formulae into BDDs and for supporting standard boolean operations on them |Bryant et. al.|

- Idea: Represent disjunctive plans as BDDs and plan extension as BDD operations
  - Proposition list at level k is an approximation to the set of states reachable in k steps.
    - » The set can be represented compactly as BDDs
    - » Plan growth can be modeled as direct manipulations on BDD
      - Operations such as "action projection" need to be modeled as BDD modifications

BDD for X, & X

AA2: Recent Advances in Al Planning A Hale J

# Relative Tradeoffs Offered by the various compilation substrates

- CSP encodings support implicit representations
  - More compact encodings [Do & Kambhampati, 2000]
  - Easier integration with Scheduling techniques
- ILP encodings support numeric quantities
  - Seamless integration of numeric resource constraints [Walser & Kautz, 1999]
  - Not competitive with CSP/SAT for problems without numeric constraints
- SAT encodings support axioms in propositional logic form
  - May be more natural to add (for whom ;-)
- BDDs are very popular in CAD community
  - Commercial interest may spur faster algorithms (which we can use)

MAz: Recent Advances in Al Plannian A Unic 11

Subbarao Kambhampa

### **Direct vs. compiled solution extraction**

### **DIRECT**

- Need to adapt CSP/SAT techniques
- ✓ Can exploit approaches for compacting the plan
- Can make the search incremental across iterations

### **Compiled**

- Can exploit the latest advances in SAT/CSP solvers
- Compilation stage can be time consuming, leads to memory blowup
- Makes it harder to exploit search from previous iterations
- Makes it easier to add declarative control knowledge

Ma: Recent Advances in Al Planning. A Hale. 117

Subbarao Kambhampat

# Disjunctive planners based on BSS and PS refinements?

Graphplan can be seen as a disjunctive planner based on state-space refinement.

- How about planners based on other refinements?
- Chief difficulty lies in generalizing the refinements to disjunctive plans, while retaining their progressivity
  - The mutex propagation step of Graphplan is what makes it progressive
- Generalization is however quite easy If we sacrifice "progressiveness" of refinements

### Basic idea

- Set up bounded length disjunctive structure
- Search for a substructure that satisfies solution properties
  - » Use lines of proofs

MAz: Recent Advances in Al Planning - A Unified 1

Subbarao Kambhampa

[Mali & Kambhampati, 1999]

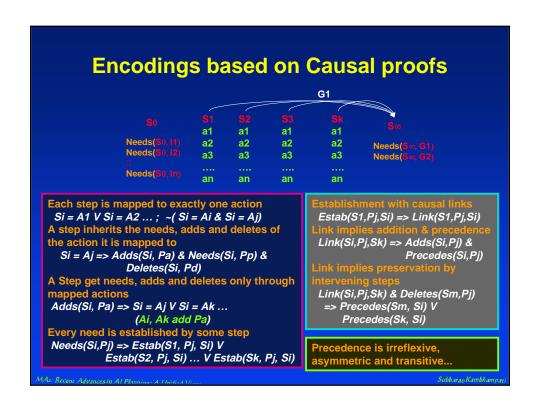

## Lines of Proof as basis for (naïve) encodings

- ♦ Loop from k=1, until a solution is found
  - Set up k-length sequence of disjunctive actions (a1 V a2 V .... V and
    - » In effect, a direct naïve refinement is used (monotonic, complete, but not progressive)
  - Impose constraints, satisfaction of which ensures that some subsequence of the disjunctive sequence is a solution
    - » The constraints set up lines of proof
      - State-space proofs
        - Graphplan's backward search can be thought of as setting up backward proof
      - Causal proofs
  - Convert the constraints into your favorite combinatorial substrate and solve

a1	a1	a1	a1
a2	a2	a2	a2

1Az: Recent Advances in ALPI

# Tradeoffs between encodings based on different proof strategies

- Causal encodings in general have more clauses than statespace encodings
  - O( #actions x #actions x #fluents) for causal link variables
    - » Could be reduced by using white-knight based proofs
  - O(#actions x #actions x #actions) clauses for partial ordering
    - » Could be reduced by using contiguous ordering
  - However, the best causal encodings will still be dominated by the backward state-space encodings [Mali & Kambhampati, 99]
- Paradoxical given the success of partial order planners in conjunctive planning?
  - Not really! We are using causal proof which is typically longer than state-based proofs, and are not using the flexibility of step insertion.
    - » Can be helpful in incremental planning & Plan reuse
    - » Are helpful in using causal domain specific knowledge (e.g. HTN schemas)

MA2: Recent Advances in Al Planning - A Hale - J 1

# Conjunctive vs. Disjunctive planners

- Progress depends on the effectiveness of the heuristics for judging the goodness of a partial plan
- Space consumption can be regulated
- Better fit with mixedinitiative, incremental planning scenarios(?)
- Space consumption is a big issue
  - Creation and storage of disjunctive structures
    - » CSPs do better by supporting implicit representations
- Connection to combinatorial substrate
- Better integration with nonpropositional reasoners (?)

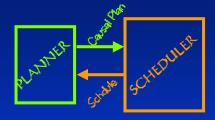

Hybrid planners--Controlled splitting & Search in the space of disjunctive plans

MA: Recent Advances in ALBI

### **Scheduling: Brief Overview CSP Models** - Time point model Jobshop scheduling » Tasks as variables, Time - Set of jobs points as values » Each job consists of tasks » EST, LFT, Machine in some (partial) order contention as constraints - Temporal constraints on jobs Inter-task precedences as » EST, LFT, Duration variables (PCP model) Contention constraints **CSP Techniques** » Each task can be done on **Customized consistency** a subset of machines enforcement techniques » ARC-B consistency » Edge-finding Customized variable/value ordering heuristics » Contention-based » Slack-based MaxCSP; B&B searches

# **Adapting to Metric/Temporal Planning**

Schedulers already routinely handle resources and metric/temporal constraints.

- Let the "planner" concentrate on causal reasoning
- Let the "scheduler" concentrate on resource allocation, sequencing and numeric constraints for the generated causal plan

Need better coupling to avoid inter-module thrashing....

1Az: Recent Advances in Al Planning - A Unified 1

Subbarao Kambhampa

# Issues in handling time and resources

- ♦ Monolithic or loosely-coupled?
- ♦ How can the Planner keep track of consistency?
  - Low level constraint propagation
    - » Loose path consistency on TCSPs
    - » Bounds on resource consumption,
    - » LP relaxations of metric constraints
  - Pre-emptive conflict resolution

The more aggressive you do this, the less need for a scheduler

- How do the modules interact?
  - Failure explanations; Partial results
- Which Planners are best suited for time and resources?\*\*

MA: Recent Advances in ALDI

# What planners are good for handling resources and time?

- State-space approaches have an edge in terms of ease of monitoring resource usage
  - Time-point based representations are known to be better for multi-capacity resource constraints in scheduling
- Plan-space approaches have an edge in terms of durative actions and continuous change
  - Notion of state not well defined in such cases (Too many states)
  - PCP representations are known to be better for scheduling with single-capacity resources
- Disjunctive compilation approaches may provide better basis for interacting with schedulers and other external constraint reasoners
  - Conjunctive approaches better for *monolithic* architectures (disjunctive ones may lead to very large encodings)

MAz: Recent Advances in Al Planning - A Haifead 17

Subbarao Kambhampai

[Adapted from David Smith's Invited Talk at AIPS-2000]

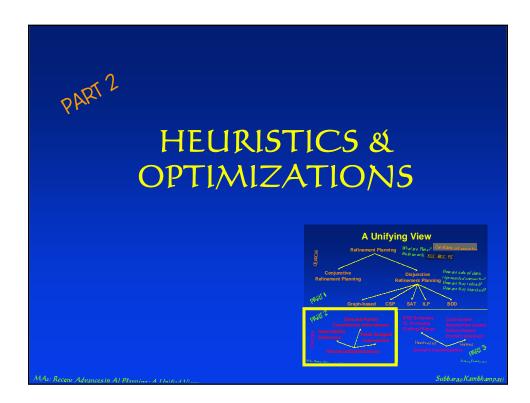

# Tradeoffs in the current implementations

	Multi-capacity Resources	Metric Quantities	Optimization	Continuous Time	Speed
Graphplan	hard?	hard IPP	hard?	hard TGP	good
SAT Compilation	moderate?	moderate LPSAT	moderate?	very hard?	good
ILP Compilation	easy?	easy ILP-plan	easy ILP-plan	very hard?	fair?
Conjunctive PS	moderate IxTeT	moderate Zeno	moderate?	easy HSTS	fair?

Work on loosely-coupled architectures is just starting... [Srivastava, 2000]

Subbarao Kambhampat

#### **Distance Heuristics from Relaxed Problems**

Problem: Estimating the distance of a (partial) state from the initial (or goal) state

Solution: Relax the problem by assuming that all subgoals are

independent (ignore +ve / -ve interactions between actions) Solve the relaxed problem and use the length of the solution as

part of the heuristic

Properties: The heuristic is neither a lower bound (-ve interactions) nor an

upper-bound (+ve interactions).

--leads to inoptimal solutions (in terms of plan length)

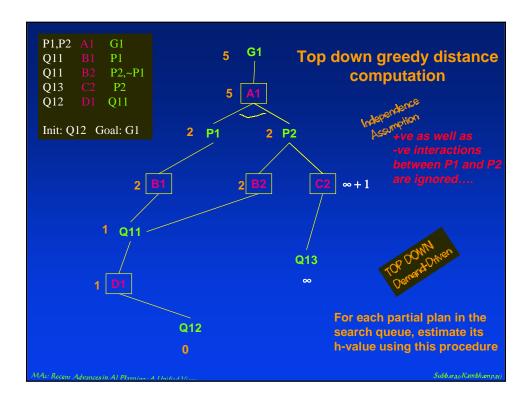

>>Possible to reduce inoptimality by considering interactions

History: First used in IxTET [Ghallab et. al. 1995]

hinted at by Smith's Operator Graphs [Smith et. al., 1995] independently re-discovered in UNPOP [McDermott, 1996]

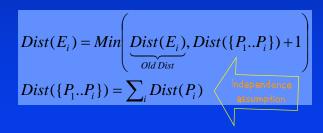

independently re-re-discovered in HSP [Bonet & Geffner, 1997]

MA2: Recent Advances in Al Planning - 4 (15:10-11)

#### **Bottom-up Distance computation**

- Each condition (state-variable & value combo) has a distance
  - Initialized to 0 for all conditions in the initial state
  - $\infty$  for everything else
- Repeat until reaching fix-point (until no distances change)
  - Select an action A to be applied. Let  $P_1 ... P_m$  be its preconditions and  $E_1 ... E_n$  be the conditions it adds.
  - Reset the distance values of E<sub>i</sub> as follows

#### **Improving the Heuristic**

- Subgoal independence assumption leads to
  - Inadmissibility (when subgoals interact positively; A is +ve)
  - Un-informedness (when subgals interact negatively; I is large)
  - **Informedness** improved by accounting for -ve interactions
    - Use information about infeasible subgoal sets ("Mutexes")
      - » No plan of length k can achieve p and q
        - » No plan can ever achieve p and q
- Admissibility can be improved by accounting for +ve interactions
  - Solve the planning problems ignoring
     -ve interactions between actions to get
     lower bound on plan length (distance)

Heuristic True Distance

A = Max, [h(s)-h\*(s)]

i = Max, [ h(s) - h\*(s) ]

States--->

MAz: Recent Advances in Al Planning - A Unified W

# Using the Planning Graph to account for +ve/-ve Interactions

- Mutex relations can help account for -ve interactions
  - Grow the PG until level-off (Polynomial operation)
  - Distance of a set {P<sub>1</sub> P<sub>2</sub>...P<sub>n</sub>} is the *index* of the first level of the PG where P<sub>1</sub>...P<sub>n</sub> are present without any mutexes
    - » Easy to generalize to n-ary mutexes
    - » Informedness can be improved by partitioning  $P_1...P_n$  into some k partitions,  $S_1...S_k$  and summing the distances of  $S_i$
- +ve interactions can be accounted for by extracting a plan from the PG ignoring mutex relations
  - Run Graphplan algorithm, but do not do any mutex propagation.

Insight: Ideas of disjunctive planning help in generating heuristics for conjunctive planners!

MA2: Recent Advances in Al Planning - 4 (Inic. 1).

Table 2: Number of actions/ Total CPU Time in seconds. The dash (-) indicates that no solution was found in 3 hours or 250MB.

[Long & Kambhampati, AAAI 2000]

MAz: Recent Advances in Al Planning - A Unified 1/1.

Subbarao Kambhampai

#### **Using Distance Heuristics**

- Conjunctive FSS planners need to recompute the heuristic as the init state changes
  - UNPOP [McDermott], HSP [Bonet & Geffner], FF [Hoffman]
    - » GRT [Refanidis & Vlahavas] elaborates the goal state and computes heuristic in the reverse direction
- Conjunctive BSS planners can get by with a single computation of the heuristic
  - HSP-R [Bonet & Geffner], AltAlt [Long & Kambhampati &..]
- Conjunctive PS planners can use distance heuristics and mutex information to rank partial plans and flaw resolution choices
  - IxTET [Ghallab et. al.]; AltAlt-UC [Long & Kambhampati]
- Disjunctive planners can use distance heuristics as the basis for variable and value ordering heuristics
  - GP-HSP [Kambhampati & Nigenda], GP-CSP [Do & Kambhampati]

MA2: Recent Advances in Al Planning. A 116.6.3

#### Other notable optimizations

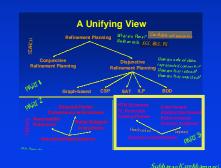

- Reduce the size of the disjunctive plan
  - Bi-level Representations [Fox & Long, 97][Smith &Weld, 97]
  - Lifted representations [Parke & Ginsberg, 2000]
  - Relevance based pruning
    - » Backward plan growth [Kambhampati et. al., 97]
    - » Preprocessing to remove irrelevant actions and conditions [RIFO, Nebel et. al. 97]
- Increase the consistency level of the disjunctive plan
  - Learn (or input) higher-order mutexes (invariants) [Gerevini,
     98] [Fox & Long, 99][Rintanen, 2000]
- Improve the solution extraction process
  - Exploit Symmetry [Fox et. al. 99, Srivastava et. al. 99]
  - + the usual retinue of search improvements from CSP, ILP etc. [Kambhampati, 2000]

MA2: Recent Advances in Al Plannian, A Linic, 11

ubbarao Kambhampa

# PLANNERS WITH DOMAIN SPECIFIC KNOWLEDGE

- 1. User-assisted customization
- 2. Automated customization

AA2: Recent Advances in Al Planning - 4 (Inter 21):

#### **Improving Performance through Customization**

- Biasing the search with control knowledge acquired from experts
  - Non-primitive actions and reduction schemas
  - Automated synthesis of customized planners
    - » Combine formal theory of refinement planning and domain-specific control knowledge
- Use of learning techniques
  - Search control rule learning
  - Plan reuse

MAz: Recent Advances in Al Planning - A Unified 1

Subbarao Kambhampa

# User-Assisted Customization (using domain-specific Knowledge) Domain independent planners tend to miss the regularities in the domain Domain specific planners have to be built from scratch for every domain An "Any-Expertise" Solution: Try adding domain specific control knowledge to the domain-independent planners Domain Specific Knowledge Domain Specific Knowledge

#### **Many User-Customizable Planners**

- Conjunctive planners
  - HTN planners
    - » SIPE [Wilkins, 85-]
    - » NONLIN/O-Plan [Tate et. al., 77-]
    - » NOAH [Sacerdoti, 75]
    - » Also SHOP (Nau et. al., IJCAI-99)
  - State-space planners
    - » TLPlan [Bacchus & Kabanza, 95; 99]
    - » TALPlan [Kvarnstrom & Doherty, 2000]
  - Customization frameworks
    - » CLAY [Srivastava & Kambhampati, 97]
- Disjunctive planners
  - HTN SAT [Mali & Kambhampati, 98]
  - SATPLAN+Dom [Kautz & Selman, 98]

Max: Recent Advances in Al Plannian A Unit 11

Subbarao Kambhamp

### With right domain knowledge any level of performance can be achieved...

- ♦ HTN-SAT, SATPLAN+DOM beat SATPLAN...
  - Expect reduction schemas, declarative knowledge about inoptimal plans
- → TLPLAN beats SATPLAN, GRAPHPLAN
  - But uses quite detailed domain knowledge
- SHOP beats TLPLAN...(but not TALPlan)
  - Expects user to write a "program" for the domain in its language
    - » Explicit instructions on the order in which schemas are considered and concatenated

M. S. M. S.

Ma: Recent Advances in Al Planning A Hale J

#### **Types of Guidance**

- Declarative knowledge about desirable or undesirable solutions and partial solutions (SATPLAN+DOM; Cutting Planes)
- Declarative knowledge about desirable/undesirable search paths (TLPIan & TALPIan)
- A declarative grammar of desirable solutions (HTN)

(largely) independent of the details of the specific planner (affinities do exist between specific types of guidance and planners)

Planner specific. Expert needs to understand the specific details of the planner's search space

- Procedural knowledge about how the search for the solution should be organized (SHOP)
- Search control rules for guiding choice points in the planner's search (NASA RAX)

MAz: Recent Advances in Al Planning - A Unifical 1/

Subbarao Kambhampa

#### Ways of using the Domain Knowledge

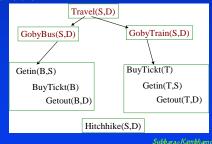

- As search control
  - HTN schemas, TLPlan rules, SHOP procedures
  - Issues of Efficient Matching
- To prune unpromising partial solutions
  - HTN schemas, TLPIan rules, SHOP procedures
  - Issues of maintaining multiple parses
- As declartative axioms that are used along with other knowledge
  - SATPlan+Domain specific knowledge
  - Cutting Planes (for ILP encodings)
  - Issues of domain-knowledge driven simplification
- Folded into the domain-independent algorithm to generate a new domain-customized planner
  - CLAY
  - Issues of Program synthesis

MA2: Recent Advances in Al Planning - A Hale - J 1

Suhharan Kambhamnai

#### **Task Decomposition (HTN) Planning**

- The OLDEST approach for providing domain-specific knowledge
  - Most of the fielded applications use HTN planning
- Domain model contains non-primitive actions, and schemas for reducing them
- Reduction schemas are given by the designer
  - Can be seen as encoding user-intent
    - » Popularity of HTN approaches a testament of ease with which these schemas are available?
- Two notions of completeness:
  - Schema completeness
    - » (Partial Hierarchicalization)
  - Planner completeness

**Modeling Action Reduction** t1: Getin(B,S) t2: BuyTickt(B) t3: Getout(B,D) Hy-Money At(Msn) → GobyBus(Phx,Msn) Buy(WiscCheese) Hv-Money In(B)t1: Getin(B,Phx) t2: BuyTickt(B) Get(Money) t3: Getout(B,Msn) Hv-Money -At(D)Buy(WiscCheese)

#### **Dual views of HTN planning**

- Capturing hierarchical structure of the domain
  - Motivates top-down planning
    - » Start with abstract plans, and reduce them
- Many technical headaches
  - Respecting user-intent, maintaining systematicity and minimality

[Kambhampati et. al. AAAI-98]

» Phantomization, filters, promisculty, downward unlinearizability

- Capturing expert advice about desirable solutions
  - Motivates bottom-up planning
    - » Ensure that each partial plan being considered is "legal" with respect to the reduction schemas
    - » Directly usable with disjunctive planning approaches

[Mali & Kambhampati, 98]

 Connection to efficiency is not obvious

Relative advantages are still unclear...

[Barrett, 97]

Subbara - Kambhaman

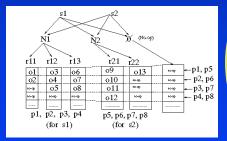

V.2. Recent Advances in Al Planning - A Haifad 1/1....

[Mali & Kambampati, AIPS-98]

#### **SAT encodings of HTN planning**

- Abstract actions can be seen as disjunctive constraints
  - K-step encoding has each of the steps mapped to a disjunction of the non-primitive tasks
  - If a step s is mapped to a task N, then one of the reductions of N must hold (\*\*The heart of encoding setup\*\*)
  - + The normal constraints of primitive action-based encoding
    - » Causal encodings seem to be a natural fit (given the causal dependencies encoded in reduction schemas)

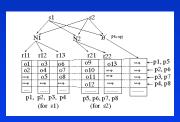

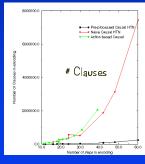

1A2: Recent Advances in Al Planning - 4 (Init. ) 1

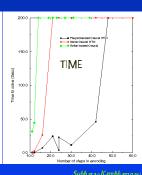

#### **Solving HTN Encodings**

Puzzle: How can increasing encoding sizes lead to efficient planning?
Abstract actions and their reductions put restrictions on the
amount of step-action disjunction at the primitive level.
--Reduction in step-action disjunction propagates
e.g. Fewer causal-link variables, Fewer exclusion clauses...

Savings won't hold if each non-primitive task has MANY reductions

1/A2: Recent Advances in Al Planning: A Haifford Vi.

[Nau et. al., 99]

#### Full procedural control: The SHOP way

Shop provides a "high-level" programming language in which the user can code his/her domain specific planner

- -- Similarities to HTN planning
- -- Not declarative (?)

The SHOP engine can be seen as an interpreter for this language

```
(:method (travel-to ?y)
    (:first (at ?x)
        (at-taxi-stand ?t ?x)
        (distance ?x ?y ?d)
        (have-taxi-fare ?d))
    `((!hail ?t ?x) (!ride ?t ?x ?y)
        (pay-driver ,(+ 1.50 ?d)))
    ((at ?x) (bus-route ?bus ?x ?y))
    `((!wait-for ?bus ?x)
        (pay-driver 1.00)
        (!ride ?bus ?x ?y)))
    Travel by bus only if going by taxi doesn't work out
```

Blurs the domain-specific/domain-independent divide
How often does one have this level of knowledge about a domain?

Ma: Recent Advances in Al Planning. A Hale. 117

[Kautz & Selman, AIPS-98]

#### **Non-HTN Declarative Guidance**

Invariants: A truck is at only one location

 $at(truck, loc1, I) \& loc1 != loc2 => \sim at(truck, loc2, I)$ 

Optimality: Do not return a package to the same location at(pkg, loc, I) &  $\sim at(pkg, loc, I+1)$  &  $I < J = \sim at(pkg, loc, j)$ 

Simplifying: Once a truck is loaded, it should immediately move  $\sim in(pkg,truck,I)$  & in(pkg,truck,I+1) & at(truck, loc, I+1) => $\sim at(truck, loc, I+2)$ 

Once again, additional clauses first increase the encoding size but make them easier to solve after simplification (unit-propagation etc).

MAz: Recent Advances in Al Planning - A Hairadt

Subbarao Kambhampa

## Rules on desirable State Sequences: TLPlan approach

TLPlan [Bacchus & Kabanza, 95/98] controls a forward state-space planner

Rules are written on state sequences using the linear temporal logic (LTL)

LTL is an extension of prop logic with temporal modalities

U until [] always
O next <> eventually

**Example:** 

If you achieve on(B,A), then preserve it until On(C,B) is achieved:

[] ( on(B,A) => on(B,A) U on(C,B) )

Ma: Recent Advances in Al Planning. A Hale. 117

#### **TLPLAN** Rules can get quite baroque

Good towers are those that do not violate any goal conditions

```
\begin{split} & goodtower(x) \stackrel{\triangle}{=} clear(x) \land goodtowerbelow(x) \\ & goodtowerbelow(x) \stackrel{\triangle}{=} (ontable(x) \land \neg \texttt{GOAL}(\exists [y : on(x,y)] \lor holding(x))) \\ & \lor \exists [y : on(x,y)] \neg \texttt{GOAL}(ontable(x) \lor holding(x)) \land \neg \texttt{GOAL}(clear(y)) \\ & \land \forall [z : \texttt{GOAL}(on(x,z))] \ z = y \land \forall [z : \texttt{GOAL}(on(z,y))] \ z = x \\ & \land goodtowerbelow(y) \end{split}
```

Keep growing "good" towers, and avoid "bad" towers

```
 \begin{array}{l} \square \Big( \forall [x : clear(x)] \ goodtower(x) \Rightarrow \bigcirc goodtowerabove(x) \\ \wedge \ badtower(x) \Rightarrow \bigcirc (\neg \exists [y : on(y,x)] \ ) \\ \wedge \ (ontable(x) \wedge \exists [y : \texttt{GOAL}(on(x,y))] \ \neg goodtower(y)) \\ \Rightarrow \bigcirc (\neg holding(x)) \Big) \end{array}
```

The heart of TLPlan is the ability to *incrementally* and *effectively* evaluate the truth of LTL formulas.

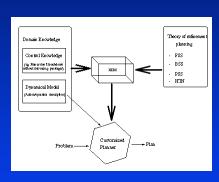

MA2: Recent Advances in Al Planning - A HniRad

Subbaraa Kambhamna

Srivastava & Kambhampati, JAIR 97

# Folding the Control Knowledge into the planner: CLAY approach

- Control knowledge similar to TLPlan's
- Knowledge is folded using KIDS semi-automated software synthesis tool into a generic refinement planning template
  - Use of program optimizations such as
    - » Finite differencing
    - » Context-dependent & independent simplification
- Empirical results demonstrate that folding can be better than interpreting rules

Caveat: Current automated software synthesis tooks have a very steep teaming curve

Subbarao Kambhamn

1A2: Recent Advances in Al Planning. 4 (16:6-31)

#### Conundrums of user-assisted cutomization

- ♦ Which planners are easier to control?
  - Conjunctive planners are better if you have search control knowledge
    - » Forward State Space (according to TLPlan)
    - » Plan-space planners (according to HTN approaches)
  - Disjunctive planners are better if your knowledge can be posed as additional constraints on the valid plans
    - » Which SAT encoding?
      - HTN knowledge is easier to add on top of causal encodings
- Which approach provides the best language for expressing domain knowledge for the lay user?
  - (Mine--no, no, Mine!)
- What type of domain knowledge is easier to validate?
- When does it become "cheating"/ "wishful-thinking"
  - Foolish not to be able to use available knowledge
  - Wishful to expect deep procedural knowledge...

MAz: Recent Advances in Al Planning - A Unified 1

Subbarao Kambhampa

### **Automated Customization of Planners**

- Domain pre-processing
  - Invariant detection; Relevance detection;
     Choice elimination, Type analysis
    - » STAN/TIM, DISCOPLAN etc.
    - » RIFO; ONLP
- Abstraction
  - » ALPINE; ABSTRIPS, STAN/TIM etc.
- Learning Search Control rules
  - » UCPOP+EBL,
  - » PRODIGY+EBL, (Graphplan+EBL)
- Case-based planning (plan reuse)
  - » DerSNLP, Prodigy/Analogy

MA2: Recent Advances in Al Planning - 4 (Inic. 1).

#### **Symmetry & Invariant Detection**

- Generate potential invariants and test them
  - DISCOPLAN [Gerevini et. al.]
    - » Allows detection of higher-order mutexes
  - Rintanen's planner
    - » Uses model-verification techniques
  - STAN/TIM
    - » Type analysis of the domain is used to generate invariants
  - ONLP (Peot & Smith)
    - » Use operator graph analysis to eliminate non-viable choices

MAz: Recent Advances in Al Planning - A Unified 1

Subbarao Kambhamp,

#### **Abstraction**

- ♦ Idea
  - Abstract some details of the problem or actions.
  - Solve the abstracted version.
  - Extend the solution to the detailed version
- Precondition Abstraction
  - Work on satisfying important preconditions first
    - » Importance judged by:
      - Length of plans for subgoals [ABSTRIPS, PABLO]
      - Inter-goal relations [ALPINE]
      - Distribution-based [HighPoint]
  - Strong abstractions (with downward refinement property) are rare
  - Effectiveness is planner-dependent
    - » Clashes with other heuristics such as "most constrained first"

MA2: Recent Advances in Al Planning - 4 (Inic. 1).

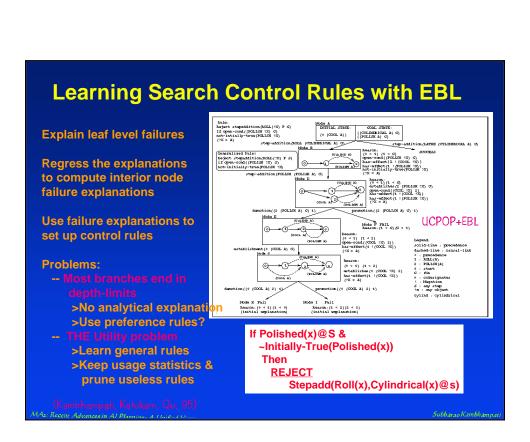

#### **Example: Abstracting Resources** Performance of Graphplan v/s Planning+Scheduling Most planners thrash by addressing planning and scheduling considerations together Eg. Blocks world, with multiple robot hands Idea: Abstract resources - Plan assuming infinite A Look into Plans by Graphplan

# Case-based Planning Macrops, Reuse, Replay

- Structures being reused
  - Opaque vs. Modifiable
  - Solution vs. Solving process (derivation)
- Acquisition of structures to be reused
  - Human given vs. Automatically acquired
- ♦ Mechanics of reuse
  - Phased vs. simultaneous
- Costs
  - Storage & Retrieval costs; Solution quality

1A: Recent Advances in ALBI

# Case-study: DerSNLP Modifiable derivational traces are reused Traces are automatically acquired during problem solving Analyze the interactions among the parts of a plan, and store plans for non-interacting subgoals separately Redivers retrieval cost Use of EBL failure analysis to detect interactions All relevant trace fragments are retrieved and replayed before the control is given to from-scratch planner Extension failures are traced to individual replayed traces, and their storage indices are modified appropriately Improves retrieval accuracy Retriever Library Froblem Case Problem Probl

#### **Reuse in Disjunctive Planning**

- Harder to make a disjunctive planner commit to extending a specific plan first
- Options:
  - Support opaque macros along with primitive actions
    - » Increases the size of k-step disjunctive plan
    - » But a solution may be found at smaller k
  - Modify the problem/domain specification so the old plan's constraints will be respected in any solution (Bailotti et. al.)
  - MAX-SAT formulations of reuse problem
    - » Constrain the encoding so that certain steps may have smaller step-action mapping and ordering choices
    - » Causal encodings provide better support

[with Amol Mali]

MAz: Recent Advances in Al Planning - A Unified 1

Subbaraa Kambhamna

#### **Summary**

- ♦ Focus on "Neo-classical" planning Refinement planning provides a unifying view
  - Conjunctive Refinement Planners
  - Disjunctive Refinement Planners
    - » Refinement
    - » Solution Extraction
      - Direct vs. compilation to CSP/SAT
- Heuristics/Optimizations
  - Relaxed Problem heuristics
  - Consistency enforcement
- Customization of planners
  - User-assisted
  - Automated
- Related approaches to non-classical planning

1A2: Recent Advances in Al Planning - 4 (Init. ) 1

#### **But who is winning???**

(Using AIPS-2000 Competition as a benchmark)

- 15 planners took part in AIPS-2000 competition
  - Representatives from all types of planners we discussed
- Competition focussed on pure classical problems
  - Separate tracks for domain-independent and usercustomized planners
- Domain independent:
  - FF (Forward state-space planning; Heuristics based on planning graphs, local search)
- **♦ Customized:** 
  - TALPlan (control knowledge about good and bad state sequences, applied to a forward state-space planner)
- Million Dollar question: Will the line-up be same for neoclassical planning (durative actions, continuous change etc?)

MAz: Recent Advances in Al Planning - A Haifead 17

Subbarao Kambhampai

#### **Status**

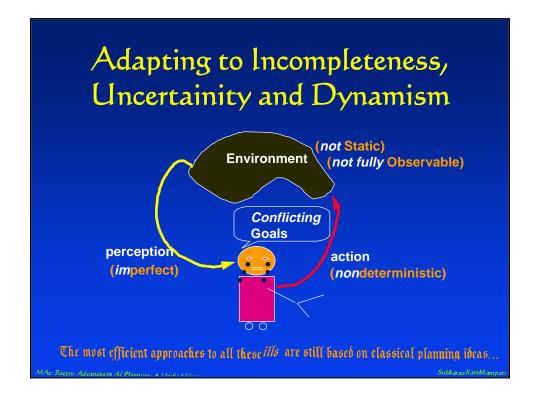

- ♦ Exciting times...
  - Many approaches with superior scale-up capabilities
    - » Broadened views of planning
  - Many influences (CSP; OR; MDP; SCM)
- Ripe for serious applications
  - VICAR [JPL]; DeepSpace monitoring [NASA/AMES]
  - Plant monitoring [Ayslett et. al.]
  - Manufacturing Process Planning [Nau et. al.;
     Kambhampati et. al]
  - Supply chain management/ Logistics
    - » Industrial "Planning" does not have to the optimal scheduling of an inoptimal action selection!

MA: Recent Advances in ALBI

#### **Incomplete Information**

- PROBLEM: Values of some state variables are unknown;
   There are actions capable of sensing (some) of them.
  - If k boolean state variables are unknown, then we are in one of 2<sup>k</sup> initial states
  - Two naïve approaches
    - » PLAN/SENSE/EXECUTE: Solve each of the 2<sup>k</sup> problems separately; At the execution time sense the appropriate variables, and execute the appropriate plan
    - » SENSE/PLAN/EXECUTE: First sense the values of the variables. Solve the problem corresponding to the sensed values
  - Problems with naïve approaches
    - » Solving the 2k problems separately is wasteful
      - Shared structure (Tree structured plans)
    - » Not all variables may be observable (or worth observing)
      - Conformant planning
        - (Find non-sensing plans that work in all worlds)
      - Irrelevant variables (Goal directed planning)

14. Perconditions and the second

Subbara - Kambhama

# Incomplete Information: Some Implemented Approaches

- Conjunctive planners
  - CNLP [Peot & Smith; 92] CASSANDRA [Pryor & Collins, 96] add sensing actions to UCPOP; support tree-shaped plans
  - SADL/PUCCINI [Golden & Weld; 96-98] integrates planning and sensing in the context of a UCPOP-like planner
- Disjunctive planners
  - CGP [Smith & Weld, 98] supports conformant planning on Graphplan
  - SGP [Weld et. al., 98] supports conditional planning on Graphplan
    - » One plan-graph per possible world/ Interactions among plangraphs captured through induced mutexes
  - [Rintanen, 99] converts conditional planning to QBF encodings

1A2: Recent Advances in Al Planning. A Hair. 11.

Suhharan Kambhamnai

#### **Dynamic Environments**

- PROBLEM: The world doesn't sit still. Blind execution of a "correct" plan may not reach goals
- > APPROACHES:
  - PLAN/MONITOR/REPLAN: Monitor the execution; when the observed state differs from the expected one, REPLAN
    - » Replanning is like reuse except there is added incentive for minimal modification
      - Easy to support with conjunctive plan-space planners
        - PRIAR [Kambhampati; 92]; DerSNLP [Ihrig & Kambhampati, 97]
      - Possible to support with disjunctive causal encodings
         [Mali, 1999]
  - MONITOR/REACT/LEARN:
    - » Policy construction (Universal plans)...
  - MODEL OTHER AGENTS CAUSING CHANGE:
    - » Collaborative/Distributed planning

MAz: Recent Advances in Al Planning - A Hulkad L

Subbarao Kambhamp

#### **Stochastic Actions**

- ♦ PROBLEM: Action effects are stochastic
  - Actions transform state-distributions to state-distributions
  - Maximize "probability" of goal satisfaction
  - Plan assessment itself is hard
- **APPROACHES:** 
  - Conjunctive planners
    - » BURIDAN [Hanks et. al., 95] uses UCPOP techniques to put candidate plans together and assesses them
      - Multiple /redundant supports
  - Disjunctive planners
    - » Pgraphplan [Blum & Langford, 98] modifies Graphplan to support some forms of stochastic planning
      - Forward search; value propagation; Envelope extension
    - » Maxplan [Majercik & Littman, 98] uses EMAJSAT encodings to solve stochastic planning problems
      - Chance variables & Choice variables. Equivalence classes of models that have the same values of choice variables. Find the equivalence class with maximum probability mass.

MA2: Recent Advances in Al Planning - 4 (Inic. 1).

Suhharao Kambhamnai

#### **Complex & Conflicting Goals**

- Problems & Solutions:
  - Goals that have temporal extent (stay alive)
    - » UCPOP, TLPlan, TGP [Smith& Weld, 99]
  - Goals that have mutual conflicts (Sky-dive & Stay Alive)
  - Goals that take cost of achievement into account
  - Goals that admit degrees of satisfaction (Get rich)
    - » Branch & Bound approaches; MAXSAT approaches
      - Pyrrhus [Williamson & Hanks; 92]

#### Decision Theoretic Approaches:

Model goals in terms of factored reward functions for Markov Decision Processes

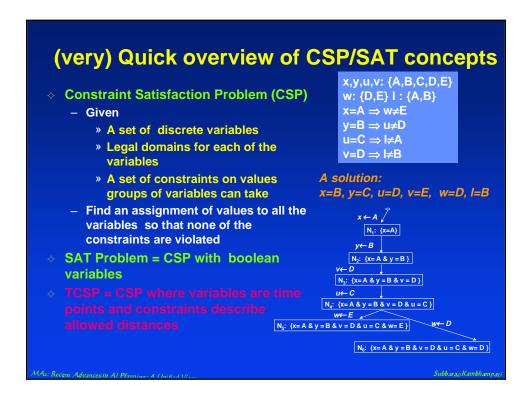

--Can utilize tricks and insights from classical planning [Boutilier, Hanks, Dean; JAIR 99]

MAz: Recent Advances in Al Planning - A Hulkad L

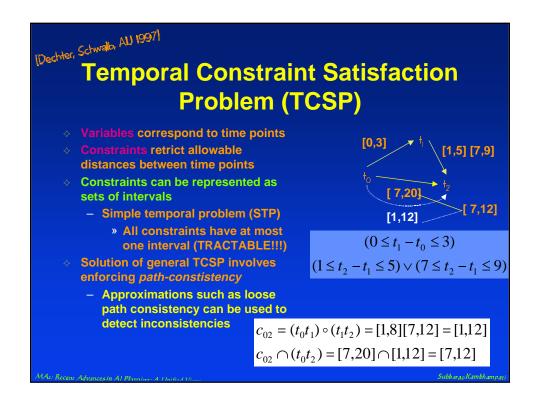

Subbarao Kambhampa

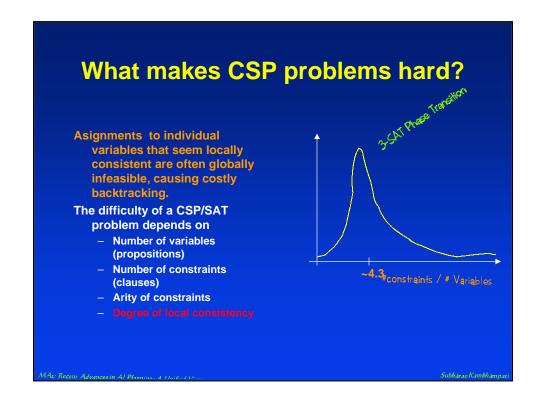

#### CSP/SAT/TCSP Review

MA2: Recene Advances in Al Planning - 4 (Inters)

#### **Hardness & Local Consistency**

- An n-variable CSP problem is said to be k-consistent iff every consistent assignment for (k-1) of the n variables can be extended to include any k-th variable
  - » Directional consistency: Assignment to first k-1 variables can be extended to the k-th variable
  - » Strongly k-consistent if it is j-consistent for all j from 1 to k
- Higher the level of (strong) consistency of problem, the lesser the amount of backtracking required to solve the problem
  - A CSP with strong n-consistency can be solved without any backtracking
- We can improve the level of consistency of a problem by explicating implicit constraints
  - Enforcing k-consistency is of O(n<sup>k</sup>) complexity
    - » Break-even seems to be around k=2 ("arc consistency") or 3 ("path consistency")
    - » Use of directional and partial consistency enforcement techniques

1Az: Recene Advances in Al Planning A Halfad 1/
